

A fixed response mechanism under a naive threshold controller

The on-policy rate alternates because the action changes the outcome used for the next decision.

Stored on-policy rate used as forecast

Action selected from that forecast

Action-specific risks stay fixed; deployed risk alternates

Loss changes with the assumed prevention cost

Exact population recurrence · no sampling noise

Source: data/performative.json. The oracle knows the mechanism; counterfactual risks and costs are model assumptions, not observed estimates.
